In this project, ChatGPT was used.

ChatGPT helped us first create BusBuddy which was eventually discarded due to our understanding of the problem being shallow and the solution we had come up with was for a problem that didn't really exist. After this, we had used ChatGPT to fix the wording and grammar on our FRs and NFRs in our System Requirements Specification. It was also in UI/UX layout in helping us know where we should put the FRs so that the user can spot it easily and won't be confused while using our app. ChatGPT was also in the Final Project Report, specifically in the 'design' and 'implementation' sections of the Golden Thread Table, to explain the definition and give examples for both of these.
